# Subjective Questions:

1. What is the optimal value of alpha for ridge and lasso regression? What will be the changes in the model if you choose double the value of alpha for both ridge and lasso? What will be the most important predictor variables after the change is implemented?

#### Ans:

The Optimal Value of alpha for Ridge Regression is 0.6.

Model performance metrics using the alpha as 0.6 are shown below:

|               | Train    | Test     |
|---------------|----------|----------|
| Ridge_MSE     | 0.018349 | 0.025502 |
| Ridge_RMSE    | 0.135457 | 0.159695 |
| Ridge_R2Score | 0.883237 | 0.845266 |

The Optimal Value of alpha for Lasso Regression is 0.0001.

Model performance metrics using the alpha as 0.0001 are shown below:

|               | Train    | Test     |
|---------------|----------|----------|
| Lasso_MSE     | 0.018335 | 0.025248 |
| Lasso_RMSE    | 0.135406 | 0.158896 |
| Lasso_R2Score | 0.883325 | 0.846811 |

Generally, if we increase the alpha value the model becomes underfitting and if we decrease the alpha value the model becomes overfitting.

Doubling the Optimal Value for Ridge Regression:

The new optimal value of alpha is 1.2.

Model performance metrics using the alpha as 1.2 are shown below:

|               | Train    | Test     |
|---------------|----------|----------|
| Ridge_MSE     | 0.018628 | 0.025113 |
| Ridge_RMSE    | 0.136483 | 0.158470 |
| Ridge_R2Score | 0.881461 | 0.847631 |

Doubling the Optimal Value for Lasso Regression:

The new optimal value of alpha is 0.0002.

Model performance metrics using the alpha as 0.0002 are shown below:

|               | Train    | Test     |
|---------------|----------|----------|
| Lasso_MSE     | 0.018135 | 0.026484 |
| Lasso_RMSE    | 0.134666 | 0.162738 |
| Lasso_R2Score | 0.884597 | 0.839312 |

Most Important Predictor Variables after doubling the optimal values are:

| Ridge (alpha = 1.2)  |             | Lasso(alpha=0.0002) |                     |             |
|----------------------|-------------|---------------------|---------------------|-------------|
| Features             | Coefficient |                     | Features            | Coefficient |
|                      |             |                     | MSZoning_RL         | 0.538465    |
| MSZoning_RL          | 0.335134    |                     | MSZoning_RH         | 0.490033    |
| MSZoning_RH          | 0.262377    |                     | MSZoning FV         | 0.440788    |
| MSZoning_FV          | 0.225064    |                     |                     | 0.430366    |
| MSZoning_RM          | 0.223024    |                     | MSZoning_RM         |             |
| ExterCond Fa         | -0.172527   |                     | ExterCond_Fa        | -0.381862   |
| Neighborhood_Somerst | 0.171598    |                     | Foundation_Stone    | 0.275779    |
|                      |             |                     | Exterior1st_BrkComm | -0.264903   |
| LandContour_Low      | 0.166616    |                     | ExterCond_TA        | -0.263576   |
| Foundation_Stone     | 0.160927    |                     | ExterCond Gd        | -0.251936   |
| Exterior2nd_VinylSd  | 0.158551    |                     | _                   | -0.214004   |
| Neighborhood_Veenker | 0.153071    |                     | GarageQual_Po       | -0.214004   |

2. You have determined the optimal value of lambda for ridge and lasso regression during the assignment. Now, which one will you choose to apply and why?

### Ans:

- The Optimal lambda Values of Ridge and Lasso are:
  - o Ridge ---- 0.6
  - o Lasso ----- 0.0001
- The MSE values of Ridge and Lasso are:
  - o Ridge (MSE Train) ----- 0.018349
  - o Ridge (MSE Test) ----- 0.025502
  - o Lasso (MSE Train) ----- 0.018335
  - o Lasso (MSE TEST) ----- 0.025248
- R2 Score of Ridge and Lasso are:
  - o Ridge (R2 Score Train) ----- 0.883237
  - o Ridge (R2 Score Test) ----- 0.845266
  - o Lasso (R2 Score Train) ----- 0.883325
  - o Lasso (R2 Score Test) ----- 0.846811

We can see that the difference in between lasso and ridge is very minute and we can see the lasso has little bit of good performance than ridge.

And also, if we compare the coefficients, we can see that lasso coefficients are near to 0 than ridge so, the variables predicted by lasso can be used in predicting the house price.

Also Lasso helps in Feature Elimination making it as simpler and more robust.

3. After building the model, you realised that the five most important predictor variables in the lasso model are not available in the incoming data. You will now have to create another model excluding the five most important predictor variables. Which are the five most important predictor variables now?

### Ans:

We have selected Lasso Model so we are dropping top 5 coefficients from it.

Alpha value is 0.0001.

Model Performance metrics:

|            |     | Train    | Test     |
|------------|-----|----------|----------|
| Lasso_N    | ИSE | 0.018335 | 0.025248 |
| Lasso_RM   | ИSE | 0.135406 | 0.158896 |
| Lasso_R2So | ore | 0.883325 | 0.846811 |

# **Dropped Features:**

| Features     | Coefficient |
|--------------|-------------|
| MSZoning_RL  | 0.538465    |
| MSZoning_RH  | 0.490033    |
| MSZoning_FV  | 0.440788    |
| MSZoning_RM  | 0.430366    |
| ExterCond_Fa | -0.381862   |

After dropping the above 5 features now after building the model the top features are: Alpha Value is 0.0001

| Features             | Coefficient |
|----------------------|-------------|
| LandContour_Low      | 0.184309    |
| Exterior2nd_VinylSd  | 0.179995    |
| Foundation_Stone     | 0.179255    |
| Neighborhood_Veenker | 0.174444    |
| BldgType_Twnhs       | -0.167209   |

#### **Model Performance Metrics:**

|               | Train    | Test     |
|---------------|----------|----------|
| Lasso_MSE     | 0.021108 | 0.028367 |
| Lasso_RMSE    | 0.145285 | 0.168424 |
| Lasso_R2Score | 0.865680 | 0.827887 |

4. How can you make sure that a model is robust and generalisable? What are the implications of the same for the accuracy of the model and why?

## Ans:

- We say a model is robust and generalisable:
  - o when it is simple but not complex.
  - The model is generalisable when the test accuracy is not lesser than the training accuracy.
  - o The model should not be impacted from outliers.
  - It should perform similar to the training set on any test set.
- The accuracy of the model can be maintained by balancing the bias and variance as it minimizes the error.
